Introduction

The Delaware Population Consortium (DPC) is pleased to continue its program of providing 30-year population and employment projections for the State, the counties, and for selected municipalities. These projections incorporate new information that has been provided to or generated by DPC members and other agencies at the federal, state, and local level.¹

The projections reflect a slight increase in the total population over last year's, largely because of an increase in the US Bureau of Census annual estimates and benchmarking to 2002 actual births and deaths.

In 1997, the DPC began releasing projections and estimates on special topics that are of interest to policy-makers, planners, and the general public but are only indirectly related to the annual projections. The DPC plans to release projections and estimates for the Census County Divisions across the state by November. An updated set of estimates for Delaware's Hispanic population will be available by the end of 2003. As in past years, these special topics will be released as independent documents.

¹ A pdf version of this document is available at <http://www.cadsr.udel.edu/demography/consortium.htm>. Also, available on the site are spreadsheets containing more age detail (single years of age for 0-100+) than is shown in this document.

History

There were many generators of population projections prior to the founding of the Delaware Population Consortium in 1975. Every new state or local jurisdiction's capital project or proposed program seemed to generate a new set of projections. Few were comprehensive in content or geographical coverage. Most studies provided only statewide, or at best countywide coverage. While other studies were localized to perhaps a single school district or a sewer district. Often, projection series were developed to deal with specific issues. Examples include projections of elderly populations, or school age children or simply the number of households.

The projections were rarely produced with standard methodologies. There was no assurance that common and nationally recognized techniques were used when forecasting and projecting. Methodologies ranged from build-out scenarios based on existing zoning to straight line projection of past trends. Frequently, they were then arbitrarily adjusted for "local factors".

The resulting projections were inconsistent. This is illustrated in six governmental reports, dealing with comprehensive development planning and population change in New Castle County. Those studies were done from the late 1950's to the late 1960's. The 1980 US Census found 398,115 persons living in New Castle County. Interest groups projected population for 1980 as follows: In 1958, the county Planning Commission projected 512,900 persons; The New Castle County Program (1964) (an intergovernmental planning group) projected 672,000 persons; The State of Delaware, Planning Office (1966) projected 670,000 (1985); University of Delaware, Cooperative extension Service (1966) projected 478,000; and The New Castle County, Department of Planning (1967) 582,000.

Each projection series was unique with respect to its starting and ending points. There was no system to evaluate the results over time or of updating them. Consultants issued many of the projections and their involvement ended with the completion of a contract.

The release of population and other counts from the 1970 US Census, raised concerns for both the accuracy of population projections, in general, and the lack of knowledge about the nature of the assumptions that were being used at the time.

"The Delaware Population Consortium was formed during August 1975, with the goal of providing a continuing forum for debate and discussion of matters relating to state and local population growth."(*Delaware Population Growth, 1975: UofD, Division of Urban Affairs.*) Under the

sponsorship of the State Planning Office, parties interested in a common set of reliable projections were brought together. They called themselves the Delaware Population Consortium (DPC). Although the State Planning Office provided sponsorship and technical support, direction was by consensus of the participants. The University of Delaware's Division of Urban Affairs prepared the initial report. This was done under contract with the State Planning Office and was financed through a comprehensive planning grant from the US Department of Housing and Urban Development.

The original core members of the DPC were from several departments of State government, the three counties, the Cities of Newark and Wilmington, WILMAPCO (the federally designated metropolitan planning organization for transportation) and the 208 Aerated Waste Treatment Management Program with technical and methodological assistance provided by the University of Delaware. In time, the program and the DPC membership has grown to include statewide representation from private utilities, citizens' groups, non-profit organizations, community, and business interests.

The DPC effort is guided by a set of objectives. They were developed early on and have been virtually unchanged over the last 20 years. They include:

1. A ***single set of projections***, in the public domain, to be widely disseminated to all users of demographic data.
2. A ***long-term horizon of thirty years*** with data provided at five-year intervals and annually for selected years. The starting point is the most recent year of the United States Census.
3. A ***single methodology*** to be utilized and fine-tuned over time.
4. A ***regular annual release date*** during the month of January of each year to ensure a predictable flow of information around which policy and decision-making can be built or monitored. (This was changed to October in 2000).
5. On-going ***review and update*** as required.
6. Projections for a ***consistent set of geographic areas*** including the State, each county, Wilmington, Dover and Newark.

The DPC is an informal organization. The organization consists of the Committee-of-the-Whole, a technical or steering committee, administrative support staff, and technical support staff.

The Committee-of-the-Whole is composed of any group or persons who have an interest in demographic projections. As a result, the composition of the committee-of-the-whole is never exactly

the same from year to year. The Committee-of-the-Whole usually meets only for the annual, October meeting. Its role is to comment on and adopt a projection series recommended by the steering committee.

The steering committee is composed of a core committee of professional demographers, planners, analysts and economists and other interested persons. Its role is to gather, monitor and analyze relevant information about changes in births, deaths, migration and employment.

Staffing is provided by volunteers, who are elected from the Committee-of-the-Whole. The organization is governed by a set of by-laws. The two operating officers are the Chair and Vice-chair.

The steering committee includes participants from the University of Delaware's Center for Applied Demographic and Survey Research, the Delaware Department of Education, the Delaware Health Statistics Center of the Delaware Department of Health and Social Services, Delaware Office of State Planning Coordination, the Delaware State Housing Authority, the Delaware Economic Development Office, and members from the county and city planning departments, WILMAPCO, and DELDOT.

The process used by DPC to produce an annual projection series is straightforward and is tied to releases of information throughout the calendar year. The previous year's projection series is evaluated against the annual July US Census estimates. The Technical Committee identifies any significant changes or newly recognized trends.

The steering committee deliberates and then produces a draft report in tabular form. The draft and revisions are produced during the spring months. The draft is then distributed to the members of the Committee-of-the-Whole, based on the last annual meetings attendance, as well as any interested party.

The annual meeting is held in October where the product and methodology are reviewed. At this time there is discussion of next year's product which can include any changes or refinements in the content of the projections or inclusion of significant events that might influence the base data and assumptions.

Methodology

The projection process begins with the 2000 age-race-gender distribution (obtained from the US Bureau of Census) for the jurisdiction being projected. This distribution is comprised of 101 separate age cohorts beginning with the 0 age group and ending with the 100-and-over age group. These projections do not yet utilize the modified age-race-gender (MARS) estimates that will be produced during 2002 to correct certain flaws in the estimates prepared by the Census Bureau in 2000.

The first step in the projection process is applying the appropriate survival rates to each single-year age-race-gender cohort. A ten-year survival rate is used to account for mortality and each age group has its own unique survival rate. Applying the appropriate survival rate to the 0 age group, for example, yields the likely number of those persons alive in that age group in 2000 will survive to enter age 1 in 2001. This procedure is followed until all age groups have been survived with the exception of the birth cohort (age 0 in 2001).

The 0 age group in 2005 is formed from all of those persons expected to be born during the 2000-2001 period. This is estimated by applying an annual birth rate for females in each separate age group beginning with 10 and ending with 49. For example, if the single-year fertility rate for females of age 30 is multiplied by the number of females in that age group in the base year, the result is the likely number of births for those females over the one-year projection period. This is done for all relevant age groups and the estimates are summed to produce the new birth cohort. The birth cohort is then survived to 2001. This procedure can then be applied for each subsequent time period 2002-2030. The end result of this two-step process is a projection of population growth due solely to natural increase (i.e., zero net-migration). Unfortunately, this is rarely the case, and net migration must be estimated.

The conventional procedure used to adjust the projections for net-migration is to calculate a migration rate for each age-race-gender category for some past time period e.g. 1990-2000, and to make assumptions about how those rates will change in the future. This procedure can work well if the migration rates from the reference period (1990-2000) reflect the future. If the nature of migration is changing, the result will probably be unsatisfactory. The rapid change in migration during the 1980's stands in stark contrast to that of the 1970's. For that reason, and the need to integrate employment projections with the population projections, another method is used to estimate migration (see *Migration* on page 8).

Mortality.

The mortality rates currently used are based on age-by-sex-by race, single-year survival rates calculated from deaths of Delaware residents from 1990-1999 and the underlying population for each cohort in the 1990-1999 interval. Using these rates as a starting point, the rates are scaled proportionally to produce the estimated number of deaths 1990-1999 using actual deaths through 1999. In addition, actual deaths for 2001 and the estimated deaths for 2002 were allowed to influence the 2003 projection. This scaling procedure was followed separately for the State, each of the counties, and the City of Wilmington, resulting in a slightly different set of mortality assumptions for each.

Fertility.

The assumptions for fertility rates were derived using births to Delaware residents from 1990-1999 and the underlying female population groups from the same period. Using these as a base, the rates are scaled proportionally to produce the estimated number of births 2001-2005 using actual births through 1995. Following the same procedures as in mortality above, actual births 2001 and estimated births in 2002 were allowed to influence the 2003 projection. This scaling procedure was followed separately for the State, each of the counties, and the City of Wilmington, resulting in a slightly different set of fertility assumptions for each.

Labor-force.

In order to balance the employment forecast with the population projections, resident employment is calculated. This calculation requires a number of assumptions. The first set of assumptions is taken from the Bureau of Labor Statistics (BLS). BLS provides the current and projected labor-force participation rates for each age-sex cohort from 2000 through 2020. Applying these rates allows the derivation of a theoretical labor-force. An unemployment rate is then applied to that theoretical labor-force. That rate is the same as the one used in generating the employment forecasts. The result of this calculation is employment by place of residence. Resident jobs are derived from employment by place of residence by making adjustments for self-employment, agricultural jobs, and multiple jobholders.

The Bureau of Labor Statistics estimates and forecasts are used to establish the starting point from the employment side. To generate an estimate for resident jobs from the employment forecasts, a single adjustment is required. Net commuting (i.e., in-commuters less out-commuters) is used to adjust the employment forecast.

Migration.

Employment (i.e., number of jobs) is usually forecast using an economic model as opposed to a demographic model. It is assumed that there will be a sufficient number of persons to fill those jobs. If the projected population due to natural increase is too low, then net in-migration is required to fill the jobs. Alternatively, if the projected population is too high, net out-migration will occur. In either case, the migration rates from the reference year are modified proportionally to produce sufficient net migration to allow the employment forecasts and the population projection to balance. The final amount of net migration is an output of the calculation. If that estimate seems too high then adjustments must be made to the employment forecasts or to one of the other assumptions in the labor-force estimate.

Adjustments.

Projecting population is a risky business and is dependent on the quality of the assumptions, and those can change from year to year as better data becomes available. Thus, it is imperative that the projections be reviewed annually. This report is the result of the Consortium's continuing monitoring and review process.

There are data that can be used to adjust the path of the projection without going through a major revision. First, the annual population estimates (not forecasts) provided by the Federal-State-Local cooperative are useful for monitoring the total population. Second, actual birth and death statistics issued by National Center for Health Statistics and the Delaware Health Statistics Center are quite valuable. Third, school enrollment data, estimated migration from the Bureau of Census and the IRS, Medicare enrollment data from HCFA, and the Current Population Survey can help with structural changes in the age groups. Finally, data from the Department of Labor tracks changes in employment growth. It is imperative that these indicators are tracked and that the projections are modified annually. These projections were carefully benchmarked to known data in 2000 (e.g. actual births, deaths, and estimated migration for the 1990-1999 period).

Notes.

This is the second set of projections that utilize the 2000 Census single year age/race/gender distributions. Because of this new benchmark data these projections may differ from previous years in a number of ways. In addition, all fertility, mortality, and migration assumptions have changed to better reflect conditions in 2002.

Usually the Consortium does not utilize the decennial Census material until the revisions have been issued and the socio-economic data has been released. However, the results of the Census were sufficiently different that a judgment was made to advance the schedule. Needless to say revisions can be expected next year.

One other point needs clarification. In the 2000 Census, respondents were permitted to check up to six races. The projection process cannot cope with that differentiation since mortality, fertility, and migration rates would have to be calculated for very small groups. To avoid that problem, all multiple race individuals were reclassified to a single race based on preferences specified in local and national survey research results.

Finally, there are several categories on the summary page for the State and each county that require some definition:

Population Change - The net increase (decrease) in persons over the projected period;

Births - The total number of births over the over the projected period;

Deaths - The total number of deaths over the projected period;

Net Migration - The total number of persons moving into the area less the number of persons leaving the area over the projected period;

Household Change - The net increase (decrease) in households over the projected period, which is indicative of the number of housing units required;

Jobs by Place of Work - The number of jobs held by civilians working in the area for the projected period excluding self-employed, private household workers, and those directly working on farms;

Jobs by Residence - The number of jobs held by the employed persons for the projected period which will include the jobs of persons who hold more than one job;

Net Commuting - The number of persons coming into the area to work each day less the number of persons leaving the area to work each day during the projected period;
