INTRODUCTION

This report contains the supporting ground-water level and chemistry data and the data collection methodology for Delaware Geological Survey Report of Investigations No. 49, "Results of the Coastal Sussex County, Delaware, Ground-Water Quality Survey" (Andres, 1991). Because raw data are commonly requested, they are published here in open-file format to accomodate those needing it for further analysis.

Figure 1 shows the locations of the wells sampled during this study and the Delaware Geological Survey (DGS) 5-minute well numbering grid for the study area. The DGS well numbering system is described by Talley and Windish (1984). Well locations plotted on 1:24,000-scale base maps are available at the DGS offices. Table 1 contains a brief statistical summary of the water-quality data. Tables 2 through 4 contain the water-quality data from the analyses of well samples. Tables 5 through 12 and figures 2 through 7 contain ground-water level data and hydrographs. The water-quality and water-level data are identified by the Delaware Geological Survey well number (DGSID) and the date collected.

WATER-QUALITY DATA COLLECTION METHODS

Sampling and Field Analytical Methods

Samples for water-quality analyses were collected by personnel from three separate agencies, Delaware Geological Survey (DGS), U. S. Geological Survey (USGS), and Delaware Division of Public Health (DPH). All samples from domestic and agricultural wells were collected by the DGS. Monitoring wells were sampled by the DGS and USGS. Public wells were sampled by DPH.

For monitoring wells sampled by the DGS, a minimum of either three to five times the volume of water in the well or approximately 50 gallons of water were removed by pumping with a gasoline-powered suction pump. In some wells, it was necessary to pump more water in order to clear the discharge of fine-grained material. When temperature, pH, and specific conductance stabilized, the discharge was free of fine-grained material, and if a representative temperature was observed, the pump discharge was sampled. The wells that yielded less than two gallons per minute (gpm) were bail sampled after pumping. Samples for dissolved oxygen and isotope analyses were collected with a point-source bail sampler. Sampling equipment (except pump) was rinsed thoroughly with distilled water and water from the well being sampled to minimize the chances of cross-contaminating samples.

Field measurements of pH and temperature were made with a Cole-Parmer 5985-80 meter; specific conductance was measured with a YSI model 33 meter. Meters were calibrated with reference solutions on a regular basis. Dissolved oxygen was determined in the field using the modified Winkler method (Hach Co., 1985). The use of brand names in this report does not constitute endorsement by the DGS.

Samples for laboratory analyses were collected in new polyethylene bottles and packed in ice. Duplicate samples were also collected at each well. Nitrate samples were preserved in the field (to pH 2) with concentrated sulfuric acid. Metals samples were preserved in the field (to pH 2) with concentrated nitric acid. Samples were transported to the laboratory within 24 hours. Samples held overnight were kept in a refrigerator at 2° C.

The sample collection procedure for domestic and agricultural wells was slightly different from that used for monitoring wells in that the sample was collected from the existing water system. In almost all cases, water from the tap closest to the pump and before treatment was sampled. The standard procedure was to measure the discharge rate and monitor water temperature, pH, and specific conductance until they stabilized and a representative water temperature was observed. Samples were collected, preserved, and transported to the laboratory in a manner similar to monitoring well samples.

Some of the analyses from monitoring wells sampled by the USGS (Ph12-05, -06, -08, -09; Ph13-03, -04, -14, -16, -18, -23, -25, -28, -29, -30, -31; Ph21-07; Ph22-08, -09, -10, -11, -12, -13, -15; Ph23-08, -10, -12, -14) were reported by James et al. (1989, 1990) and are not repeated in this report. Samples from public wells were collected by the Division of Public Health using internally established procedures.

Results of analyses of samples taken from selected public supply wells were obtained from the records of the Delaware Division of Public Health. When available, results from two successive years were acquired. In all cases the sample was collected before any type of water treatment. In almost all cases, samples were collected at the well head. Well construction details were obtained for all wells included in the study.

Laboratory Notes

Water-quality analyses were done by five laboratories: Artesian Laboratories, Inc. (ALI); Delaware Division of Public Health (DPH) (public supply wells only); University of Delaware, College of Marine Studies (UDCMS); USGS Denver Laboratory; and the DGS. The analytical methods for some of the chemical constituents (nitrate, chloride, sulfate, iron) used by the laboratories were not always the same. In order to assess the reliability of data from any laboratory several checks were completed. In some cases replicate samples were analyzed by different laboratories (e.g., DGS and ALI, ALI and UDCMS). In other cases results were compared to results of field tests from the same sample or to previous and subsequent samples. When analytical methods were markedly different and these checks indicated a problem, the data

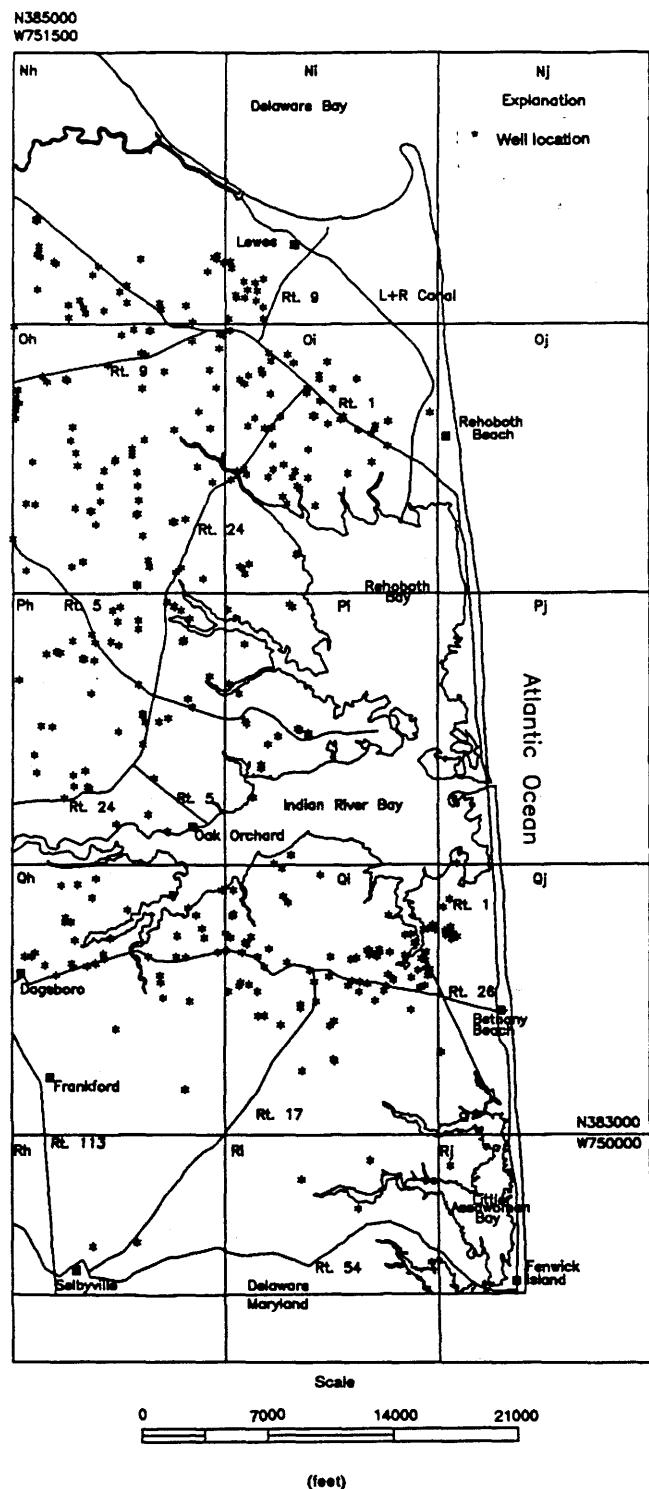

Figure 1. Map showing locations of wells sampled.

Table 1. Statistical summary of water-quality data.

Notes:

Multiple samples from any well have been averaged.

Includes selected data reported in James et al. (1989, 1990).

Sulfate and metals results from domestic wells are included in the monitoring well data set.

mg/l = milligrams per liter, ft bbls = feet below land surface, umho = micromhos, deg C = degrees Celsius, gpm = gallons per minute

All analyses with the result non-detectable are treated as 0 s in calculations.

were not used (e.g., specific conductance and dissolved solids measured by USGS, and pH measured by DPH).

The DPH and ALI laboratories used the testing and quality control methods described by the U. S. Environmental Protection Agency (U. S. EPA, 1983) and participate in the U. S. EPA and State laboratory certification programs. The USGS laboratory follows analytical and quality control methods described by Skougstad et al. (1979).

The UDCMS laboratory, supervised by William Ullman, performed analyses for chloride, sulfate, and nitrate (prior to October 1988) by suppressed anion chromatography with a Dionex Model 4000i ion chromatograph using a bicarbonate - carbonate eluent. Nitrate analyses done after October 1988 were analyzed by the automated cadmium-reduction method. Alkalinity and chloride titrations were performed in the DGS laboratory using a Hach Company digital titrator and manufacturer-standardized titrant cartridges (Hach Company, 1985). Alkalinity analyses were performed within 24 hours of sample collection. Chloride analyses were always performed within 48 hours of sample collection and usually within 24 hours. Geochron Laboratories, Cambridge, Massachusetts, performed isotopic analyses.

Quality Assurance

Several quality assurance steps were employed to check the reliability of laboratory and sample-collection procedures. Laboratory results were first checked by comparing results to other samples from the area and to field-measured constituents. Replicate samples were retested if the reported results did not appear to be representative. Blind replicate samples also were analyzed for nitrate and chloride. The accuracy of the DGS laboratory chloride analyses was checked by having duplicate analyses of replicate samples done by ALI. The effect of holding time on reported nitrate concentration was also checked. Replicate samples of unpreserved, refrigerated samples were retested at time intervals ranging from one to four weeks. The results of statistical comparisons show that there are no differences between laboratories for both chloride and nitrate replicate samples. The results of laboratory comparisons are available from the author.

Table 5. Ground-water levels for Nh45-02, -03, -04, -05, -06, -10, -11, -12.

Note: ft bmp = feet below measuring point.

WELL — Nh45-02
LOCATION — Lat 384612, long 751012
OWNER — University of Delaware
WELL CHARACTERISTICS — Bored monitoring well, dia 2 in., depth 29 ft, cased to 24 ft, screened 24 to 29 ft.
DATUM — Elevation NGVD 1929 is 12.88 ft. Measuring point: top of casing.
NOTE — Water levels most likely are tidally affected.

WELL — Nh45-05
LOCATION — Lat 384612, long 751012
OWNER — University of Delaware
WELL CHARACTERISTICS — Bored monitoring well, dia 2 in., depth 7 ft, cased to 2 ft, screened 2 to 7 ft.
DATUM — Elevation NGVD 1929 is 5.43 ft. Measuring point: top of casing.
NOTE — Water levels are tidally affected.
